

A head-to-Specifier Movement Account of Multiple Pre-Subject Modals in Mandarin Chinese

Haoming Li & Jackie Yan-Ki Lai

University of Chicago

April 2021

Thesis

Pre-subject modal constructions in Mandarin Chinese are derived from post-subject modal constructions through head-to-specifier movement of the modals to Spec, FocP.

Table of Contents

- 1 Introduction
 - Modals in Mandarin Chinese
 - Multiple-Modal Constructions
 - Subject-Merge Approaches

- 2 Head-to-Specifier Movement
- 3 Conclusion

Modals in Mandarin Chinese

There are three kinds of modals in Mandarin Chinese, which can appear in the same sentence:

- epistemic (M_{epis}): *keneng* ‘it may be the case that ...’ *yinggai* ‘it should be the case that ...’
- deontic (M_{deon}): *bixu* ‘must,’ *dei*, ‘must,’ *keyi* ‘be allowed to’
- dynamic (M_{dyn}): *keyi* ‘be able to,’ *neng* ‘be able to’

There is usually the ordering of $M_{\text{epis}} \prec M_{\text{deon}} \prec M_{\text{dyn}}$:

- (1) Zhangsan *keneng bixu* qu Chengdu.
Zhangsan MAY MUST go Chengdu
‘It may be the case that Zhangsan must go to Chengdu.’
- (2) Zhangsan *bixu neng* zuo zhe ti.
Zhangsan MUST BE.ABLE solve this problem
‘It is required that Zhangsan be able to solve this problem.’

Modals in Mandarin Chinese

They can either appear to the left of the subject or to the right:

- (3) a. **keneng** Zhangsan qu Chengdu.
MAY Zhangsan go Chengdu
'It may be the case that Zhangsan will go to Chengdu.'
- b. Zhangsan **keneng** qu Chengdu.
Zhangsan MAY go Chengdu
'It may be the case that Zhangsan will go to Chengdu.'

The first kind we will call pre-subject modal constructions; the second, post-subject modal constructions.

Multiple-Modal Constructions in Mandarin Chinese

This is also true when there are multiple modals:

- (4) a. **yinggai dei** Huang laoshi shuo hua le.
 should must Huang teacher say speech SP
 ‘It should be the case that Teacher Huang must speak now.’
- b. Huang laoshi **yingai dei** shuo hua le.
 Huang teacher SHOULD MUST say speech SP
- le*, glossed as SP, is a sentence-final aspectual particle.

Subject-Merge Approaches

- By Subject-Merge approaches, we mean those deriving post-subject modal constructions from pre-subject modal constructions through either Internal Merge or External Merge of the subject, such as topicalization (Tsai, 2015; Pan, 2018), raising (Lin, 2010, 2012), or control (Lin, 2010, 2012; Pan, 2018).
- We will illustrate this camp of approaches with Lin's 2010; 2012 account of modals.

Problems with Subject-Merge

Hsu (2019) provides a host of arguments against Subject-Merge approaches.

- Pre-subject modal constructions are more marked in terms of information structure than post-subject counterparts; post-subject ones should be the base case.
- Pre-subject modal constructions display focus-related properties that cannot be explained by Subject-Merge approaches.

Information-Structural Markedness

- Pre-subject modal constructions express *propositional focus*, so it is the entire proposition that is in focus rather than a sub-constituent; post-subject ones are pragmatically neutral.
- We expect the more neutral structure to be the base case.
- In the following example, only the pre-subject modal construction is felicitous in this special context, when the entire proposition should be in focus. Post-subject modal constructions do not have this special focus property.

Informational-Structural Markedness

(6) [Context: Both A and B hear the doorbell ringing.]

A: zenme le?

how SP

‘What happened?’

B: yinggai Zhangsan mai pisa huilai-le

should Zhangsan buy pizza return-PFV

‘It should the case that Zhangsan has bought pizzas and now returned.’

B': #Zhangsan yinggai mai pisa huilai-le

Zhangsan should buy pizza return-PFV

‘Zhangsan should have bought pizzas and now returned.’

(Hsu, 2019, 24, ex. (10))

Focus Intervention

It has been observed that focus operators (F-Op) will interfere with interrogative operators (Q-Op) (Beck, 2006):

(7) *Beck-style intervention effects*

*[Q-Op_x ... F-Op [TP ... wh_x ...]]

Pre-subject modal constructions display the same effects:

(8) ***Q-Op**_x [FocP yinggai **F-Op** Zhangsan xihuan-guo **shei**_x ne]
 should Zhangsan like-EXP who Q

Intended: 'Who should have Zhangsan liked?'

(Hsu, 2019, 32, ex. (23a))

There is no way for Subject-Merge approach to derive such an effect.

Head Movement Approaches

Hsu (2019) involves a drastically different approach. Now, post-subject modal constructions are the base configurations, while pre-subject ones are derived from them through head movement of the modal. The presence of a Foc^0 head, indicating propositional focus, draws modals to it across the subject.

Hsu (2019)

(9) Hsu's (2019) Proposal

Problems of Hsu (2019) – HMC

However, the head movement approach fails to generate multiple pre-subject modal constructions. We know by the

(11) Head Movement Constraint (Travis, 1984, 131)

An X^0 may only move into the Y^0 which properly governs it.
that we cannot skip heads in head movement.

Problems of Hsu (2019) – HMC

The local structural context of the Chinese involved, according to studies such as Erlewine (2017); Lin (2010), is as follows. Notice the intervening head *le* between the two modals.

(12)

Problems of Hsu (2019) – Order of Multiple Modals

Additionally, Hsu (2019) predicts the wrong order of the moved heads. Left adjunction of heads is usually expected for head movement (Kayne, 1994); it has also been argued that Mandarin Chinese only allows left adjunction (Lin, 2012; Paul and Whitman, 2010). Then, if head movement were the mechanism for deriving multiple pre-subject modals, lower heads should surface to the left of higher heads.

Problems of Hsu (2019) – Order of Multiple Modals

(14)

Problems of Hsu (2019) – Order of Multiple Modals

This is clearly not the case, as we see in this same example, that the order of the moved heads is the same the same order:

- (15) **keneng_i** **keyi_j** Lisi [_{M_{epis}P} **t_i** [_{SP₁P} [_{M_{deon}P} **t_j** qu canjia
 MAY BE.ALLOWED Lisi go join
 bisai] [_{SP₁} le]]]
 competition SP
 ‘It may be the case that Lisi is now allowed to join the
 competition.’

An Interim Summary

- Subject-Merge approaches lack focus-related explainability
- The only Head Movement approach, Hsu (2019), only accommodates a single pre-subject modal

The aim then is to come up with a solution to both problems.

Table of Contents

 - Subject-Merge Approaches
 - Head Movement Approaches
- 2 Head-to-Specifier Movement
- 3 Conclusion

The Current Proposal

Our proposal of head-to-specifier movement is such a solution, based on head-to-specifier movement. Head-to-spec movement is proposed in Harizanov and Gribanova (2019); Harizanov (2019), primarily with reference to Bulgarian:

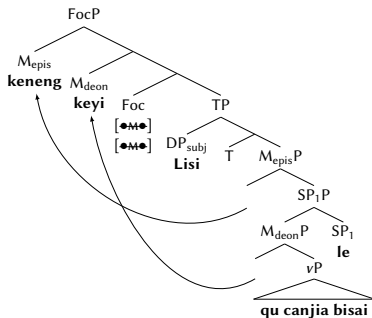

- (16) a. šte si bila **pročela** knjigata [Bulgarian]
FUT be-2.SG been-FEM read-FEM book-the
‘You will have read the book.’
(Embick and Izvorski, 1997, ex. (30a))
- b. **pročela**₁ šte si bila —₁ knjigata [Bulgarian]
read-FEM FUT be-2.SG been-FEM book-the
(Embick and Izvorski, 1997, ex. (30c))

Head-to-Spec Movement

Here, the verb head engages in displacement that clearly violates the HMC, making head-to-head movement unlikely. Therefore, the mechanism involved is phrasal movement, or Internal Merge, of the verb. This is exactly the mechanism we propose for multiple pre-subject modal constructions in Chinese.

The Derivation

- Foc^0 has multiple $[\bullet\text{M}\bullet]$ features
- They attract M_{epis} , M_{deon} , or M_{dyn} to Spec, FocP
- Tucking-In (Richards, 2001) keeps the relative order of the modals unchanged
- Presence of Foc^0 confers propositional focus
- Intervening Foc^0 between wh-Op and the variable derives focus intervention

Tucking-In

When α and β are both attracted by the same head, the (subsequent) movement of β must create a specifier *lower* than the specifier created by movement of α (Richards, 2001).

(17) Ko₁ si koga₂ tvrdio da je t₁ istukao t₂?

who AUX whom claimed that AUX beaten

‘Who did you claim beat whom?’

(Željko Bošković, 1997, Serbo-Croatian)

Tucking-In

Since in a multiple pre-subject modal constructions, all modals are attracted by the same Foc^0 head, we can apply Tucking-In to produce the correct order:

- (18) $[\text{FocP } \text{kenengi}_i \text{ keyi}_j \text{ Foc}^0 \text{ Lisi } [\text{M}_{\text{episP}} t_i [\text{SP}_1\text{P } [\text{M}_{\text{deonP}} t_j \text{ qu}$
MAY BE.ALLOWED Lisi go
canjia bisai] $[\text{SP}_1 \text{ le}]]]]]$

join competition SP

'It may be the case that Lisi is now allowed to join the competition.'

Tucking-In

The left adjunction in traditional movement *reverses* the base order
 (19)

Tucking-In of phrasal movement resulting from a single head
preserves the base order, which is desired.

Obviation of HMC

Notice that since our approach no longer assumes head movement, as does Hsu (2019), there is no reason for the derivation to follow the Head Movement Constraint either. The fact that the SP_1 *le* intervenes between modals moved to the left of the subject does not pose a problem to our approach. Foc^0 , with $[\bullet M \bullet]$ features, only attracts modals, and no other hands, in this case, to its specifier.

Minimality

However, this obviation of HMC does not mean that the movement proposed is unrestricted. Due to Relativized Minimality (Rizzi, 1990), movement to Spec, FocP cannot skip *modals*. So our approach predicts that only the highest modals can be moved to Spec, FocP, which is borne out.

- (20) **keyi*_i Lisi *yinggai* *t*_i qu canjia bisai
 BE.ALLOWED Lisi SHOULD go join competition
 ‘It may be the case that Lisi is now allowed to join the competition.’

Focus-Related Properties

Our approach, further, preserves the focus-related explainability of Hsu (2019), which is lacking in all of the Subject-Merge approaches.

- (21) ***Q-Op_x** [_{FocP} yinggai_i [_{Foc'} **Foc⁰** Zhangsan *t_i* xihuan-guo
should Zhangsan like-EXP
shei_x ne]]?
who Q

Intended: 'Who should have Zhangsan liked?'

(Hsu, 2019, 32, ex. (23a))

Propositional focus is trivially predicted with the presence of Foc^0 ; focus-intervention retained, since Foc^0 still intervenes between the *wh*-operator and the bound variable.

- 1 Introduction
 - Modals in Mandarin Chinese
 - Multiple-Modal Constructions
 - Subject-Merge Approaches
 - Head Movement Approaches
- 2 Head-to-Specifier Movement
- 3 Conclusion

Conclusion

In this talk, we have seen that our head-to-specifier movement approach successfully accounts for all the properties of multiple pre-subject modal constructions hitherto observed, which no previous analysis is able to accomplish.

- Focus: propositional focus and focus intervention
- Information-structural markedness
- No HMC effects
- Minimality effects
- Preservation of base order

Conclusion
